

BridgeEDI — Client Test Workflow

Client handoff checklist · BridgeEDI / Zodiac

Purpose: Hand this to the client (or run yourself) to verify the first-customer experience after deploying the latest branch (`phase12-first-customer-ready` + contrast fix).

Production note: bridgeedi.com must be redeployed for these fixes to appear. Until then, test on staging/local with the latest code.

What was built (so far)

Area	What the client should see
Admin login	<code>/</code> — operator console
Customer portal login	<code>/customer/login</code> — separate door
Create customer	Workspace settings created automatically
Create customer user + assign	One form; customers readable (high contrast)
Workspace Settings	ERP, government, adapter, pipeline, readiness wizard
Pipeline gate	Cannot enable until ERP + adapter + government ready
Customer portal	Overview → Invoices → SAT → Monitoring → AI Ops → Settings → Logout
Isolation	Customer cannot stay on admin pages
Monitoring demo	Seed script can populate sample success/fail runs

Pre-test setup (internal)

- Deploy frontend + API from `phase12-first-customer-ready` (plus latest contrast commit if separate).
- Confirm API health.
- Optional demo data: `bash cd zodiac python scripts/seed_first_customer_demo.py --customer-id DE875243162 --seed-monitoring-only`
- Know credentials: - Admin: operator account - Customer: e.g. `demo.portal@bridgeedi.local` (portal password from seed/admin)

A. Admin path (15–20 min)

#	Step	Expected
1	Open <code>/</code> and sign in as admin	Dashboard loads
2	Open Customers → Add Customer	Form readable; create succeeds

#	Step	Expected
3	Open Customer users → Create customer user	Modal: dark text on white; customer IDs readable; Cancel readable; Close (X) visible
4	Assign one customer ID → Create	User appears in list with assignment
5	Edit customers on that user	Same contrast; Save works
6	Open Workspaces → customer → Settings	Readiness wizard + progress
7	Configure ERP URL + secret refs, enable <code>mx_cfdi</code> , government endpoint → Save	Checklist advances
8	Enable Pipeline (only if unlocked) → Save	Succeeds; if incomplete, blocked with message
9	Open Monitoring / AI Ops	Counts or seeded transactions visible
10	Logout	Back to admin login

Fail if: ghost-white text on white modal; customer IDs unreadable; pipeline enables with empty ERP/gov.

B. Customer path (10–15 min)

#	Step	Expected
1	Open <code>/customer/login</code>	Customer Portal branding
2	Sign in as portal user	Lands on <code>/customer/overview</code>
3	Confirm only their company ID	No other tenants
4	Walk Overview → Invoices → SAT → Monitoring → AI Ops → Settings	All load; no Coming Soon; no admin sidebar
5	Try <code>/dashboard</code> or <code>/customers</code>	Redirected to portal (spinner only — no admin flash)
6	Settings	Read-only configuration
7	Logout	<code>/customer/login</code>

Fail if: admin menu visible; other customer data visible; blank/broken pages.

C. Contrast / UX smoke (2 min)

On a machine with **OS dark mode ON**:

1. Open `/customer-users` → Create customer user
2. Confirm body is light (white), text is dark
3. Confirm Assign list IDs are dark monospace, not washed out

D. What to tell the client

BridgeEDI gives your company a private login and portal. Our team onboards you in the admin console (customer, users, ERP, government, pipeline). Your users only see your invoices, tax documents, monitoring, and settings. AI explains operations — it does not send invoices. To go live we plug in your real ERP and government credentials in the same Settings screens.

Sign-off checklist (send back)

- ☐ Admin create customer works
- ☐ Create/assign user modal readable (dark mode OS OK)
- ☐ Workspace settings + readiness wizard works
- ☐ Customer portal login + full nav works
- ☐ Isolation verified
- ☐ Monitoring shows data (live or seeded)
- ☐ No Coming Soon on portal path
